Amendments to the Claims:

Claim 1 (currently amended): A method for modifying a schematic over the <u>an</u> Internet, comprising:

establishing a connection between a client and a server;

displaying the schematic on the client; wherein the schematic includes components that comprise wire components and electrical components that are movable within the schematic;

choosing a component to modify; and

modifying the component within the schematic; and

analyzing the modified schematic.

- 2. (currently amended): The method of Claim 1, further comprising using block symbols to represent at least a portion of a schematic wherein modifying the component within the schematic comprises selecting a wire component; determining an endpoint of the wire component to move; and moving the end point of the wire component.
- 3. (original) The method of Claim 1, wherein choosing a component further comprises providing a palette of choices to a user from which to select at least one from a component and a block.
- 4. (currently amended): The method of Claim 3, wherein the component may be is selected from a wire component, an electrical component, a simulation component and a block.
- 5. (original) The method of Claim 4, wherein modifying the component within the schematic further comprises adjusting one of a wire location, a component location, and a block symbol location.
- 6. (original) The method of Claim 1, further comprising scaling the schematic to provide a different level of detail.

- 7. (original) The method of Claim 1, further comprising providing user controlled panning and scanning for the schematic on the client.
- 8. (original) The method of Claim 4, wherein modifying the component within the schematic further comprises providing a grid to aid placement of the component within the schematic.
- 9. (original) The method of Claim 4, further comprising generating a netlist in response to the modification of the schematic.
- 10. (currently amended): The method of Claim 4, further comprising generating a component connectivity list which may be is used to generate a simulation.
- 11. (currently amended): A modulated data signal embodied in a carrier wave and representing computer executable instructions for modifying a schematic over the <u>an</u> Internet, comprising:

establishing a connection between a client and a server;

displaying the schematic within a web page on the client; wherein the schematic includes components that comprise wire components and electrical components that are movable within the schematic;

choosing a component to modify within the web page; and

modifying the component within in the schematic within the web page; wherein modifying the component may comprise: moving an endpoint of a wire component and removing the component from the schematic within the web page; and

analyzing the modified schematic.

12. (original) The modulated data signal of Claim 11, further comprising generating a block symbol to represent at least a portion of the schematic.

- 13. (currently amended): The modulated data signal of Claim 12, wherein the component may be is chosen from a wire component, an electrical component, and a simulation component.
- 14. (currently amended): The modulated data signal of Claim 14 13, wherein modifying the component within in the schematic further comprises adjusting one of a wire location, a component location, and a block symbol location.
- 15. (original) The modulated data signal of Claim 11, further comprising generating a netlist on the client in response to the modification of the schematic.
- 16. (currently amended): A system for modifying a schematic over a network, comprising:
- a client having a client network connection device, the client network connection device operative to connect the client and a user to the network;
- a server having a server network connection device, the server network connection device operative to connect the server to the network; and
 - a schematic modification device, operative to perform actions, including:

displaying the schematic within a web page on the client; wherein the schematic includes components that comprise wire components and electrical components that are movable within the schematic;

choosing a component to modify within the web page; and modifying the component in the schematic within the web page; and analyzing the modified schematic.

17. (original) The system of Claim 16, wherein the schematic modification device further comprises actions to generate a block symbol to represent at least a portion of the schematic.

- 18. (original) The system of Claim 16, wherein the schematic modification device further comprises actions to choose a component from a wire component, an electrical component, and a simulation component.
- 19. (currently amended): The system of Claim 18, wherein modifying the component within in the schematic further comprises adjusting at least one of one of a wire location, a component location, and a block symbol location.
- 20. (original) The system of Claim 16, further comprising generating a netlist in response to the modification of the schematic.
- 21. (currently amended): The system of Claim 16, further comprising generating a component connectivity list which may be is used to generate a simulation.
- 22. (currently amended): An apparatus for modifying a schematic over the <u>an</u> Internet, comprising:

means for establishing a connection between a client and a server;

means for displaying the schematic within a web page on the client; wherein the schematic includes components that comprise wire components and electrical components that are movable within the schematic;

means for choosing a component to modify within the web page; and
means for modifying the component <u>in the schematic</u> within the web page; and
means for analyzing the modified schematic.
